Ventilated capsule-type flow compensating digital perspirometer

SMN-1000SR

Portable and easy to carry.

- •The A5-sized case makes the SMN-1000SR easy to carry and use.
- •It can be connected to a computer via a single cable.
- •It supports data storage on memory cards, and the built-in battery enables usage without connecting to an external power source or device.

•It supports wireless communication using a Bluetooth LE-compatible PC or smartphone. (SMN-1000SR only)

Uses the flow compensation method.*

- ·It can stably measure heavy sweating.
- •It is capable of high-responsivity measurements.
- *Patented technology

What is a ventilated capsule-type perspirometer?

A ventilated capsule-type perspirometer is a simple perspiration meter that does not require dry air as it uses the air in the measurement environment as a reference. Air is supplied to the capsule that covers the skin, and the amount of sweat is measured from the humidity difference between the air before and after it passes through the skin.

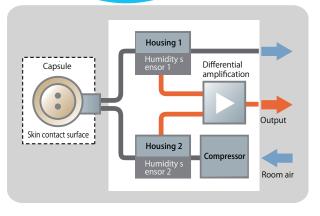

What is the flow compensation method?

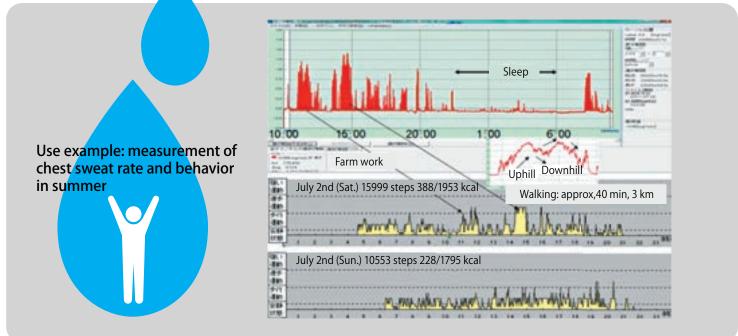

When there is a small amount of sweating, the air flow rate is reduced to increase sensitivity, and when there is a large amount of sweating, the airflow rate is increased to increase the dynamic range.

Changing the airflow rate in this manner, it is possible to stably measure from small to large amounts of sweating.

The output value is adjusted to be linear with respect to the amount of sweating (the amount of water evaporated from the skin).

Ventilated capsule-type flow compensating digital perspirometer

Specifications

Product name	SMN-1000S	SMN-1000SR			
Major specifications					
Operating mechanism	Ventilated capsule-type differential method				
Number of channels	1Ch				
Flow rate	Flow rate compensation method (300-1,000mL)				
Analog outpu	Voltage output ± 5 V **1V = 1mg/min. The voltage [V] recorded by the recorder can be converted directly into the amount of sweat [mg/(cm2 • min)].				
Digital output	USB				
Wireless output		Bluetooth LE			
Display	Measurement value display				
Memory function	Memory card				
Power supply	6 V (for battery charging)				
Built-in battery	2000 mAh (continuous operation time: 4 hours or so)				
Accessories	 Main unit Data transmission cable Dedicated memory card Recording analysis software AC adapter charger 				
Recommended use conditions	Temperature: 23.5℃ Humidity: 60% RH				
Properties					
Start-up time	~1 s				
Measurement range	0-3 mg/(cm2/min)				
Accuracy (error rate)	±10% (under recommended conditions, range 0-1 mg/(cm2/min)
